Oxymetholone (Anadrol)

Dosage

The drug must be used in a strict time frame. The course of administration is usually from 2 to 4 weeks. It is strongly not recommended to use a steroid for more than 6 weeks, due to its detrimental effect on the liver. The effect of oxymetholone is completely dose-dependent. At a dosage of up to 150 mg of the drug – it retains water well. If the amount is from 200 mg per day, then the fluid will be retained several times less. The optimal consumption rate directly depends on the weight of the athlete. According to calculations, about 5 mg of oxymetholone is taken per kg of weight. Although weighing 100-120 kg, a daily dose of 300 mg will be more than enough.

Side effects

One of the most pronounced side effects is fluid buildup in the muscles. In this situation, work in the gym becomes simply unbearable. Other negative aspects include high blood pressure, acne, insomnia, vomiting, pain in the abdomen, diarrhea, gynecomastia, etc. Some men have frequent erections, baldness and testicular atrophy.

Reception effects

- Increased muscle mass;
- Elimination of pain;
- Improving the stamina and mobility of the joints;
- High motivation.
